Global Optimization Lecture 17 Prof. Bodik CS 164 Lecture 17

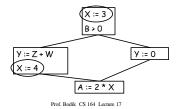

Correctness

- How do we know it is OK to globally propagate constants?
- · There are situations where it is incorrect:

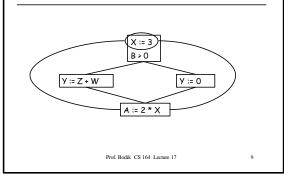

Correctness (Cont.)

To replace a use of x by a constant k we must know that:

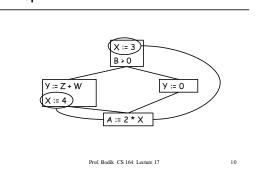

On every path to the use of x, the last assignment to x is x := k

Prof. Bodik CS 164 Lecture 17

Example 1 Revisited

Example 2 Revisited

Discussion

- The correctness condition is not trivial to check
- "All paths" includes paths around loops and through branches of conditionals
- · Checking the condition requires global analysis
 - An analysis of the entire control-flow graph for one method body

Prof. Bodik CS 164 Lecture 17

11

Global Analysis

Global optimization tasks share several traits:

- The optimization depends on knowing a property X at a particular point in program execution
- Proving X at any point requires knowledge of the entire method body
- It is OK to be <u>conservative</u>. If the optimization requires X to be true, then want to know either
 - · X is definitely true
 - · Don't know if X is true
- It is always safe to say "don't know"

Prof. Bodik CS 164 Lecture 17

Global Analysis (Cont.)

- Global dataflow analysis is a standard technique for solving problems with these characteristics
- Global constant propagation is one example of an optimization that requires global dataflow analysis

Prof. Bodik CS 164 Lecture 17

Global Constant Propagation

- Global constant propagation can be performed at any point where ** holds
- Consider the case of computing ** for a single variable X at all program points

Prof. Bodik CS 164 Lecture 17

CS 164 Lecture 17

Global Constant Propagation (Cont.)

 To make the problem precise, we associate one of the following values with X at every program point

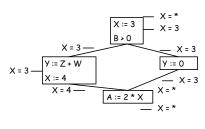

value	interpretation
#	This statement is not reachable
С	X = constant c
*	Don't know if X is a constant

Prof. Bodik CS 164 Lecture 17

15

17

Example

Prof. Bodik CS 164 Lecture 17

16

18

Using the Information

- Given global constant information, it is easy to perform the optimization
 - Simply inspect the x = ?associated with a statement using x
 - If x is constant at that point replace that use of x by the constant
- But how do we compute the properties x = ?

Prof. Bodik CS 164 Lecture 17

The Idea

The analysis of a complicated program can be expressed as a combination of simple rules relating the change in information between adjacent statements

Prof. Bodik CS 164 Lecture 17

Explanation

- The idea is to "push" or "transfer" information from one statement to the next
- For each statement s, we compute information about the value of x immediately before and after s

 $C_{in}(x,s)$ = value of x before s $C_{out}(x,s)$ = value of x after s

Prof. Bodik CS 164 Lecture 17

Transfer Functions

- Define a <u>transfer function</u> that transfers information from one statement to another
- In the following rules, let statements have immediate predecessor statements $p_1,...,p_n$

Prof. Bodik CS 164 Lecture 17

20

Rule 1

if $C_{out}(x, p_i) = *$ for some i, then $C_{in}(x, s) = *$

Prof. Bodik CS 164 Lecture 17

Rule 2

If $C_{out}(x, p_i) = c$ and $C_{out}(x, p_j) = d$ and $d \neq c$ then $C_{in}(x, s) = *$

Prof. Bodik CS 164 Lecture 17

22

Rule 3

if $C_{out}(x, p_i) = c$ or # for all i, then $C_{in}(x, s) = c$

Prof. Bodik CS 164 Lecture 17

23

Rule 4

if $C_{out}(x, p_i) = \#$ for all i, then $C_{in}(x, s) = \#$

Prof. Bodik CS 164 Lecture 17

The Other Half

- · Rules 1-4 relate the out of one statement to the in of the successor statement
 - they propagate information forward across CFG
- Now we need rules relating the in of a statement to the out of the same statement
 - to propagate information across statements

Prof. Bodik CS 164 Lecture 17

Rule 5

$$C_{out}(x, s) = \# \text{ if } C_{in}(x, s) = \#$$

Prof. Bodik CS 164 Lecture 17

Rule 6

 $C_{\text{out}}(x, x := c) = c$ if c is a constant

Prof. Bodik CS 164 Lecture 17

Rule 7

$$C_{out}(x, x := f(...)) = *$$

Prof. Bodik CS 164 Lecture 17

Rule 8

$$C_{\text{out}}(x, y := ...) = C_{\text{in}}(x, y := ...)$$
 if $x \neq y$

Prof. Bodik CS 164 Lecture 17

29

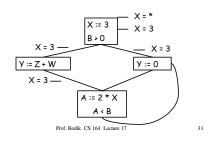

An Algorithm

- 1. For every entry s to the program, set $C_{in}(x, s) = *$
- 2. Set $C_{in}(x, s) = C_{out}(x, s) = \#$ everywhere else
- 3. Repeat until all points satisfy 1-8: Pick s not satisfying 1-8 and update using the appropriate rule

Prof. Bodik CS 164 Lecture 17

The Value

• To understand why we need #, look at a loop

Discussion

- Consider the statement Y := 0
- To compute whether X is constant at this point, we need to know whether X is constant at the two predecessors
 - X := 3
 - A := 2 * X
- But info for A := 2 * X depends on its predecessors, including Y := 0!

Prof. Bodik CS 164 Lecture 17

32

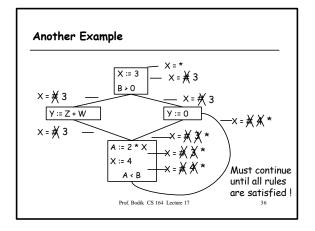

The Value # (Cont.)

- Because of cycles, all points must have values at all times
- Intuitively, assigning some initial value allows the analysis to break cycles
- The initial value # means "So far as we know, control never reaches this point"

Prof. Bodik CS 164 Lecture 17

33

Example X = * X := 3 x = # 3 B > 0 X = **∦** 3 X = **¥** 3 Y := Z + W -×=¥3 x = **¥** 3 A := 2 * X ×= ¥ 3 We are done when all rules are satisfied! Prof. Bodik CS 164 Lecture 17

Orderings

· We can simplify the presentation of the analysis by ordering the values

< c < *

· Drawing a picture with "lower" values drawn lower, we get

Orderings (Cont.)

- · * is the greatest value, # is the least
 - All constants are in between and incomparable
- · Let lub be the least-upper bound in this ordering
- Rules 1-4 can be written using lub: $C_{in}(x, s) = lub \{ C_{out}(x, p) \mid p \text{ is a predecessor of } s \}$

Prof. Bodik CS 164 Lecture 17

Termination

- Simply saying "repeat until nothing changes" doesn't guarantee that eventually nothing changes
- · The use of lub explains why the algorithm terminates
 - Values start as # and only increase
 - # can change to a constant, and a constant to *
 - Thus, $C_{(x, s)}$ can change at most twice

Prof. Bodik CS 164 Lecture 17

Termination (Cont.)

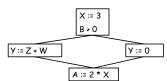

Thus the algorithm is linear in program size

Number of steps = Number of $C_{(...)}$ values computed * 2 = Number of program statements * 4

Prof. Bodik CS 164 Lecture 17

Liveness Analysis

Once constants have been globally propagated, we would like to eliminate dead code

After constant propagation, X := 3 is dead (assuming this is the entire CFG)

Prof. Bodik CS 164 Lecture 17

Live and Dead

- The first value of x is dead (never used)
- The second value of x is live (may be used)
- · Liveness is an important concept

X := 3

Prof. Bodik CS 164 Lecture 17

Liveness

A variable x is live at statements if

- There exists a statement s' that uses x
- There is a path from s to s'
- That path has no intervening assignment to \boldsymbol{x}

Prof. Bodik CS 164 Lecture 17

Global Dead Code Elimination

- A statement x := ... is dead code if x is dead after the assignment
- Dead statements can be deleted from the program
- But we need liveness information first . . .

Prof. Bodik CS 164 Lecture 17

'S 164 Lecture 17

Computing Liveness

- We can express liveness in terms of information transferred between adjacent statements, just as in copy propagation
- Liveness is simpler than constant propagation, since it is a boolean property (true or false)

Prof. Bodik CS 164 Lecture 17

45

47

Liveness Rule 1

 $L_{out}(x, p) = \sqrt{\{L_{in}(x, s) \mid s \text{ a successor of p }\}}$

Prof. Bodik CS 164 Lecture 17

Liveness Rule 2

 $L_{in}(x, s)$ = true if s refers to x on the rhs

Prof. Bodik CS 164 Lecture 17

Liveness Rule 3

 $L_{in}(x, x := e) = false if e does not refer to x$

Prof. Bodik CS 164 Lecture 17

Liveness Rule 4

 $L_{in}(x, s) = L_{out}(x, s)$ if s does not refer to x

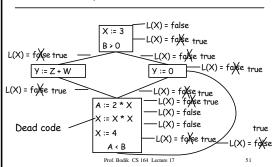

Prof. Bodik CS 164 Lecture 17

Algorithm

- 1. Let all L_(...) = false initially
- 2. Repeat until all statements s satisfy rules 1-4
 Pick s where one of 1-4 does not hold and update
 using the appropriate rule

Prof. Bodik CS 164 Lecture 17

Another Example

Termination

- A value can change from false to true, but not the other way around
- Each value can change only once, so termination is guaranteed
- Once the analysis is computed, it is simple to eliminate dead code

Prof. Bodik CS 164 Lecture 17

Forward vs. Backward Analysis

We've seen two kinds of analysis:

Constant propagation is a forwards analysis: information is pushed from inputs to outputs

Liveness is a backwards analysis: information is pushed from outputs back towards inputs

Prof. Bodik CS 164 Lecture 17

53

Analysis

- · There are many other global flow analyses
- Most can be classified as either forward or backward
- Most also follow the methodology of local rules relating information between adjacent program points

Prof. Bodik CS 164 Lecture 17
